

## **SYSTEM AND METHOD FOR PROVIDING A TRANSLATIONAL DICTIONARY**

### **ABSTRACT OF THE DISCLOSURE**

5           The invention concerns a method (400, 500) of providing a  
translational dictionary. The method includes the steps of receiving (416,  
516) at a communications device (114) a signal from a network (116),  
recognizing (418, 518) at least one target language from the receipt of the  
network signal, comparing (420, 520) the target language to a base language  
10 of the communications device and selectively transferring (434) to the  
communications device a translational dictionary of the target language if the  
target language does not match the base language. In one arrangement, if  
the target language does not match the base language, the method can also  
include the step of notifying (430) a user that the translational dictionary of the  
15 target language is available for transfer and giving (432) the user the option of  
accepting the transfer of the translational dictionary of the target language.
